

Equivalent Fractions

Independent Practice

Name: _____

Date: _____

INDEPENDENT PRACTICE — SHOW YOUR THINKING

1. A strip is cut into 4 equal parts and 2 are shaded. Split each piece in half. How many pieces now? How many shaded? Write both fractions.

2. Draw a strip showing $\frac{1}{3}$ shaded. Now split each piece into 2 equal parts. Write the new fraction. Are the two fractions equivalent? How do you know?

3. Hazel says $\frac{2}{4}$ and $\frac{1}{2}$ are the same amount. Sketch two strips to prove she is right.

4. A strip is cut into 6 equal parts and 3 are shaded. Group every 3 pieces into 1 bigger piece. Write both fractions.

Equivalent Fractions (continued)

5. Felix says $\frac{3}{6}$ and $\frac{2}{4}$ are equivalent because both equal one-half. Draw strips to check. Is Felix right?

6. Fill in the blank: $\frac{1}{2} = \frac{\quad}{8}$. Sketch a strip to show your answer.

7. Reflection: why does splitting every piece into the same number of smaller pieces give you an equivalent fraction?
